HealthInsFraud_v2

August 5, 2021

1 Background to the Case Study:

1.0.1 Healthcare programs, in the United States (U.S.), have experienced tremendous growth in patient populations and commensurate costs and Fraud is a major contributor to these inflating healthcare expenses.

1.0.2 Many healthcare providers settle huge amounts for patients. But some insured individuals or the provider of health services attempt to make fake claims by giving false claim details such as showing fake bills, submitting same bills repeatedly etc.

2 Business Objective

2.0.1 The primary objective is a binary classification task of each of the provider as either a Fraud or a Non-Fraud.Since the data is related to fraud, the dataset is imbalanced as the number of providers, who commit a fraud is very small proportion when compared to the overall dataset.

3 Evaluation Metric

3.0.1 I will be considering the No Fraud cases a Positive class and the Fraud cases as a Negative class. Considering the problem statement and the class imbalance in the dataset, I intend to explore the following parameters:

3.0.2 1. Precision and Recall: Since we are dealing with a fraud identification problem with a class imbalance, metrics such as Accuracy do not precisely evaluate the models. Hence, I will be going for an evaluation metric such as Precision and Recall.

3.0.3 2. AUC score: As it gives an overall view of the classification performance of each of the models

3.0.4 3. F1 score or Macro F1 score (due to class imbalances): In this case both precision and recall are particularly important as we need to cover as many fraud cases as possible.

4 Description of the Dataset

4.0.1 The dataset consists of the fraud label data for a total of 5410 providers and the labels for these providers are provided in a separate file titled "Train.csv".

4.0.2 The dataset that has been provided to us consists of 3 different csv files that has the Inpatient, Outpatient and the Beneficiary data. Each of the healthcare providers are identified by a unique ID and this ID is a part of the outpatient and the Inpatient datasets which also carry the beneficiary ID.

4.1 Importing the Requisite Libraries

[1]:
```
import os
import csv
import json
import pickle
import shutil
import random
import warnings
warnings.filterwarnings('ignore')
import numpy as np
import pandas as pd
import seaborn as sns
from tqdm import tqdm
import matplotlib.pyplot as plt
from datetime import datetime,timedelta
from sklearn.impute import SimpleImputer
from matplotlib.gridspec import GridSpec
from sklearn.metrics import roc_curve
from sklearn.metrics import f1_score
from sklearn.metrics import recall_score
from sklearn.metrics import roc_auc_score
from sklearn.metrics import precision_score
from sklearn.metrics import confusion_matrix
from sklearn.preprocessing import StandardScaler
from sklearn.neighbors import KNeighborsClassifier
from sklearn.model_selection import train_test_split
from sklearn.model_selection import RandomizedSearchCV
from sklearn.calibration import CalibratedClassifierCV
from sklearn.feature_extraction.text import CountVectorizer
```

[ ]:
```
from google.colab import drive
drive.mount('/content/drive')
```

```
Mounted at /content/drive
```

4.2 Analysis of the Train Datasets

4.3 Loading the Train Datasets

[ ]:
```
train_ben= pd.read_csv('/content/drive/MyDrive/Colab Notebooks/
 ↪Train_Beneficiarydata.csv')
train_inpat= pd.read_csv('/content/drive/MyDrive/Colab Notebooks/
 ↪Train_Inpatientdata.csv')
train_outpat= pd.read_csv('/content/drive/MyDrive/Colab Notebooks/
 ↪Train_Outpatientdata.csv')
train_y= pd.read_csv('/content/drive/MyDrive/Colab Notebooks/Train.csv')
```

[ ]:
```
train_ben.head()
```

[ ]:

	BeneID	DOB	...	OPAnnualReimbursementAmt	OPAnnualDeductibleAmt

out_prov= np.unique(train_outpat['Provider'])
print("The number of Unique Providers in the Train_Outpat file:", len(out_prov))

in_prov= np.unique(train_inpat['Provider'])
print("The number of Unique Providers in the Train_Inpat file", len(in_prov))

com_prov= set(out_prov).intersection(set(in_prov))
print("The number of Providers common to both the Inpat and Outpat files:
 ↪",len(com_prov))

uni_ele= len(out_prov)+len(in_prov)-len(com_prov)
print("Total Number of Unique Providers in Outpatient and Inpatient datasets␣
 ↪Together:",uni_ele)
```

```
The number of Unique Providers in the Train_Outpat file: 5012
The number of Unique Providers in the Train_Inpat file 2092
The number of Providers common to both the Inpat and Outpat files: 1694
Total Number of Unique Providers in Outpatient and Inpatient datasets Together:
5410
```

4.4 Observations on the Train Datasets

1. We observed that the labels of Potential Fraud as "Yes" or "No" have been provided to the each of the Providers in the dataset.
2. The number of Unique Providers in the Dataset is 5410 as can be seen in the "Train" file.
3. Hence,checking for the unique Providers in the Inpatient and the Outpatient files.
4. From the above, we observed that that the total number of Providers are spread across the Inpatient and Outpatient Files.

4.4.1 Looking at the diffeerent columns present in each of the datasets

[ ]:
```
print("The columns in the Outpatient Dataset are:",train_outpat.columns)
print("="*100)
print("The columns in the Inpatient Dataset are:",train_inpat.columns)
print("="*100)
print("The columns in the Beneficiary Dataset are:",train_ben.columns)
```

```
The columns in the Outpatient Dataset are: Index(['BeneID', 'ClaimID',
'ClaimStartDt', 'ClaimEndDt', 'Provider',
       'InscClaimAmtReimbursed', 'AttendingPhysician', 'OperatingPhysician',
       'OtherPhysician', 'ClmDiagnosisCode_1', 'ClmDiagnosisCode_2',
       'ClmDiagnosisCode_3', 'ClmDiagnosisCode_4', 'ClmDiagnosisCode_5',
       'ClmDiagnosisCode_6', 'ClmDiagnosisCode_7', 'ClmDiagnosisCode_8',
       'ClmDiagnosisCode_9', 'ClmDiagnosisCode_10', 'ClmProcedureCode_1',
       'ClmProcedureCode_2', 'ClmProcedureCode_3', 'ClmProcedureCode_4',
       'ClmProcedureCode_5', 'ClmProcedureCode_6', 'DeductibleAmtPaid',
       'ClmAdmitDiagnosisCode'],
      dtype='object')
====================================================================================
====================
The columns in the Inpatient Dataset are: Index(['BeneID', 'ClaimID',
'ClaimStartDt', 'ClaimEndDt', 'Provider',
       'InscClaimAmtReimbursed', 'AttendingPhysician', 'OperatingPhysician',
       'OtherPhysician', 'AdmissionDt', 'ClmAdmitDiagnosisCode',
       'DeductibleAmtPaid', 'DischargeDt', 'DiagnosisGroupCode',
       'ClmDiagnosisCode_1', 'ClmDiagnosisCode_2', 'ClmDiagnosisCode_3',
       'ClmDiagnosisCode_4', 'ClmDiagnosisCode_5', 'ClmDiagnosisCode_6',
       'ClmDiagnosisCode_7', 'ClmDiagnosisCode_8', 'ClmDiagnosisCode_9',
       'ClmDiagnosisCode_10', 'ClmProcedureCode_1', 'ClmProcedureCode_2',
       'ClmProcedureCode_3', 'ClmProcedureCode_4', 'ClmProcedureCode_5',
       'ClmProcedureCode_6'],
      dtype='object')
====================================================================================
====================
The columns in the Beneficiary Dataset are: Index(['BeneID', 'DOB', 'DOD',
'Gender', 'Race', 'RenalDiseaseIndicator',
       'State', 'County', 'NoOfMonths_PartACov', 'NoOfMonths_PartBCov',
       'ChronicCond_Alzheimer', 'ChronicCond_Heartfailure',
       'ChronicCond_KidneyDisease', 'ChronicCond_Cancer',
       'ChronicCond_ObstrPulmonary', 'ChronicCond_Depression',
       'ChronicCond_Diabetes', 'ChronicCond_IschemicHeart',
       'ChronicCond_Osteoporasis', 'ChronicCond_rheumatoidarthritis',
       'ChronicCond_stroke', 'IPAnnualReimbursementAmt',
       'IPAnnualDeductibleAmt', 'OPAnnualReimbursementAmt',
       'OPAnnualDeductibleAmt'],
      dtype='object')
```

4.4.2 Checking for common columns between the Outpatient and the Ipatient datasets seperately

[ ]:
```
#Checking each of the columns in the Outaptient dataset if they are present in␣
 ↪the Inpatient Dataset
c_o=[]
for o in train_outpat.columns:
    if o in train_inpat.columns:
        c_o.append(o)

#Checking each of the columns in the Inpatient dataset if they are present in␣
 ↪the Outpatient dataset
c_i=[]
for i in train_inpat.columns:
    if i in train_outpat.columns:
        c_i.append(i)
print("Cols of Outpatient dataset also present in Inpatient dataset",len(c_o))
print("Cols of Inpatient dataset also present in Outpatient dataset",len(c_i))

#Checking for common column names in the outpatient and the inpatient datasets
c_s= set(c_o).intersection(set(c_i))
c_s= list(c_s)
print("Common columns between the outpatient and the inpatient␣
 ↪datasets",len(c_s))
```

```
Cols of Outpatient dataset also present in Inpatient dataset 27
Cols of Inpatient dataset also present in Outpatient dataset 27
Common columns between the outpatient and the inpatient datasets 27
```

[ ]:
```
print(c_s)
```

```
['BeneID', 'ClmProcedureCode_1', 'ClmDiagnosisCode_3', 'OperatingPhysician',
'ClaimStartDt', 'ClmProcedureCode_4', 'DeductibleAmtPaid', 'ClmDiagnosisCode_1',
'ClmDiagnosisCode_8', 'OtherPhysician', 'ClmProcedureCode_3',
'ClmDiagnosisCode_7', 'ClmDiagnosisCode_9', 'ClmProcedureCode_5',
'AttendingPhysician', 'ClmDiagnosisCode_5', 'ClmProcedureCode_6',
'ClmProcedureCode_2', 'ClmDiagnosisCode_10', 'ClaimEndDt',
'ClmAdmitDiagnosisCode', 'ClmDiagnosisCode_6', 'Provider', 'ClaimID',
'InscClaimAmtReimbursed', 'ClmDiagnosisCode_2', 'ClmDiagnosisCode_4']
```

4.4.3 Merging the Outpatient and the Inpatient datasets based on the common columns between both the datasets. We will be doing an outer merge as we need to take the union of all the elements in both the datasets

[ ]:
```
train_fin_df= pd.
 ↪merge(train_inpat,train_outpat,left_on=c_s,right_on=c_s,how='outer')
train_fin_df.shape
```

[ ]: (558211, 30)

[ ]:
```
train_fin_df.head(2)
```

[ ]:
```
      BeneID   ClaimID  ... ClmProcedureCode_5 ClmProcedureCode_6
0  BENE11001  CLM46614  ...                NaN                NaN
1  BENE11001  CLM66048  ...                NaN                NaN

[2 rows x 30 columns]
```

4.4.4 Merging the resultant dataset with Beneficiary data on the BeneID column in both teh datasets

[ ]:
```
train_fin= pd.merge(train_fin_df,train_ben, left_on='BeneID',right_on='BeneID',how='outer')
train_fin.shape
```

[ ]: (558211, 54)

[ ]:
```
print("The columns in the final merged dataset are:",train_fin.columns)
```

```
The columns in the final merged dataset are: Index(['BeneID', 'ClaimID',
'ClaimStartDt', 'ClaimEndDt', 'Provider',
       'InscClaimAmtReimbursed', 'AttendingPhysician', 'OperatingPhysician',
       'OtherPhysician', 'AdmissionDt', 'ClmAdmitDiagnosisCode',
       'DeductibleAmtPaid', 'DischargeDt', 'DiagnosisGroupCode',
       'ClmDiagnosisCode_1', 'ClmDiagnosisCode_2', 'ClmDiagnosisCode_3',
       'ClmDiagnosisCode_4', 'ClmDiagnosisCode_5', 'ClmDiagnosisCode_6',
       'ClmDiagnosisCode_7', 'ClmDiagnosisCode_8', 'ClmDiagnosisCode_9',
       'ClmDiagnosisCode_10', 'ClmProcedureCode_1', 'ClmProcedureCode_2',
       'ClmProcedureCode_3', 'ClmProcedureCode_4', 'ClmProcedureCode_5',
       'ClmProcedureCode_6', 'DOB', 'DOD', 'Gender', 'Race',
       'RenalDiseaseIndicator', 'State', 'County', 'NoOfMonths_PartACov',
       'NoOfMonths_PartBCov', 'ChronicCond_Alzheimer',
       'ChronicCond_Heartfailure', 'ChronicCond_KidneyDisease',
       'ChronicCond_Cancer', 'ChronicCond_ObstrPulmonary',
       'ChronicCond_Depression', 'ChronicCond_Diabetes',
       'ChronicCond_IschemicHeart', 'ChronicCond_Osteoporasis',
       'ChronicCond_rheumatoidarthritis', 'ChronicCond_stroke',
       'IPAnnualReimbursementAmt', 'IPAnnualDeductibleAmt',
       'OPAnnualReimbursementAmt', 'OPAnnualDeductibleAmt'],
      dtype='object')
```

4.4.5 Merging the Y variable with the final dataset

[ ]:
```
train_fin= pd.merge(train_fin,train_y,left_on='Provider',right_on='Provider',how='outer')
train_fin.shape
```

[ ]:
```
(558211, 55)
```

[ ]:
```
train_fin.columns
```

[ ]:
```

4.6 Looking at the Class Distribution in the Train Dataset

[ ]:
```
#Calculating the number of row items where the Provider is NOT a Potentila␣
 ↪fraud in percentage terms
tr_no_per= np.round((train_y.value_counts()[0])/(train_y.
 ↪value_counts()[0]+train_y.value_counts()[1]),3)*100

#Calculating the number of row items where the Provider is a Potentila fraud in␣
 ↪percentage terms
tr_yes_per= np.round((train_y.value_counts()[1])/(train_y.
 ↪value_counts()[0]+train_y.value_counts()[1]),3)*100

#Calculating the number of row items where the Provider is NOT a Potentila␣
 ↪fraud in percentage terms
cv_no_per= np.round((cv_y.value_counts()[0])/(cv_y.value_counts()[0]+cv_y.
 ↪value_counts()[1]),3)*100

#Calculating the number of row items where the Provider is a Potentila fraud in␣
 ↪percentage terms
cv_yes_per= np.round((cv_y.value_counts()[1])/(cv_y.value_counts()[0]+cv_y.
 ↪value_counts()[1]),3)*100

#Plotting the Potential and Non Potential Fraud scenarios
fig= plt.figure(figsize=(10,5))
gs= GridSpec(1,2, figure=fig)

ax1= fig.add_subplot(gs[0,0])
ax2= fig.add_subplot(gs[0,1])

sns.barplot(ax= ax1,x=['Non-Fraud',"Fraud"],y=␣
 ↪[tr_no_per,tr_yes_per],palette='crest')
sns.barplot(ax= ax2,x=['Non-Fraud',"Fraud"],y=␣
 ↪[cv_no_per,cv_yes_per],palette='crest')

ax1.title.set_text("Distribution of the Train_y Data Labels")
```

```
ax2.title.set_text("Distribution of the CV_y Data Labels")
ax1.set_ylabel("Percentage of Providers")
ax2.set_ylabel("Percentage of Providers")

plt.show()
```

4.7 Observations

1. We see that there are is a 60:40 split between the number of observations belonging to the Non-Fraud class and the Fraud class.

2. Using the Stratify option in the Train-Test split has ensured that class distribution of the observationn belongig to the Non-Fraud and Fraud cases has remained the same in both Train and CV datasets

[ ]:
```
print("Percenatage of Non-Fraud class in Train dataset:",tr_no_per,'%')
print("Percenatage of Fraud class in Train dataset:",tr_yes_per,'%')
print("Percenatage of Non-Fraud class in Cross Validate dataset:",cv_no_per,'%')
print("Percenatage of Fraud class in Cross Validate dataset:",cv_yes_per,'%')
```

```
Percenatage of Non-Fraud class in Train dataset: 61.9 %
Percenatage of Fraud class in Train dataset: 38.1 %
Percenatage of Non-Fraud class in Cross Validate dataset: 61.9 %
Percenatage of Fraud class in Cross Validate dataset: 38.1 %
```

4.8 Checking for the percentage of nan values in each of the columns in the Train Data

[ ]:
```
na_perc= np.round(((train_fin.isna().sum())/train_fin.shape[0])*100,2)

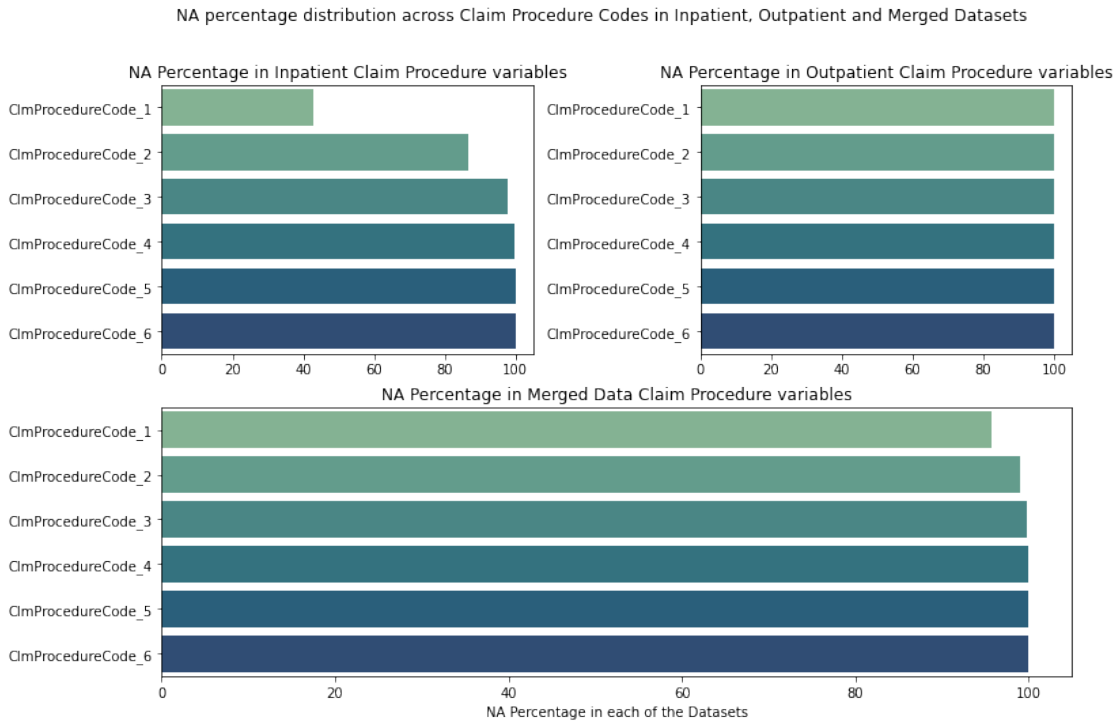
ax2.title.set_text('NA Percentage in Outpatient Claim Procedure variables')
ax3.title.set_text('NA Percentage in Merged Data Claim Procedure variables')

plt.subplots_adjust(wspace=0.45)
plt.xlabel("NA Percentage in each of the Datasets")
plt.show()
```



4.11 Observations

1. We see that there are 100% NA values in the Outpatient dataset in all of the claim Procedure columns. This is because most of the outpatients do not undergo procedures.

2. In case of a need for a complex procedure, the patients are admitted and are treated as inpatients

3. High percenatge of the NA values in the merged datasets is not due to missing data but due to the reason that the size of the Outpatient dataset is much higher than the Inpatient dataset

4. As most of the outptient dataset claim procedure has a high values of NA, they are introducing skewness in the merged dataset.

4.12 Feature Engineering

1. Each of the cliam procedure codes indicates a different procedure hence the counting the number of procedured performed effectively captures the information carried by the 6 different claim procedure columns.

2. I have created a new feature capturing the number of procedures performed for each of the patients. Higher the number of procedures it is highly likely that higher is the complexity of the case.

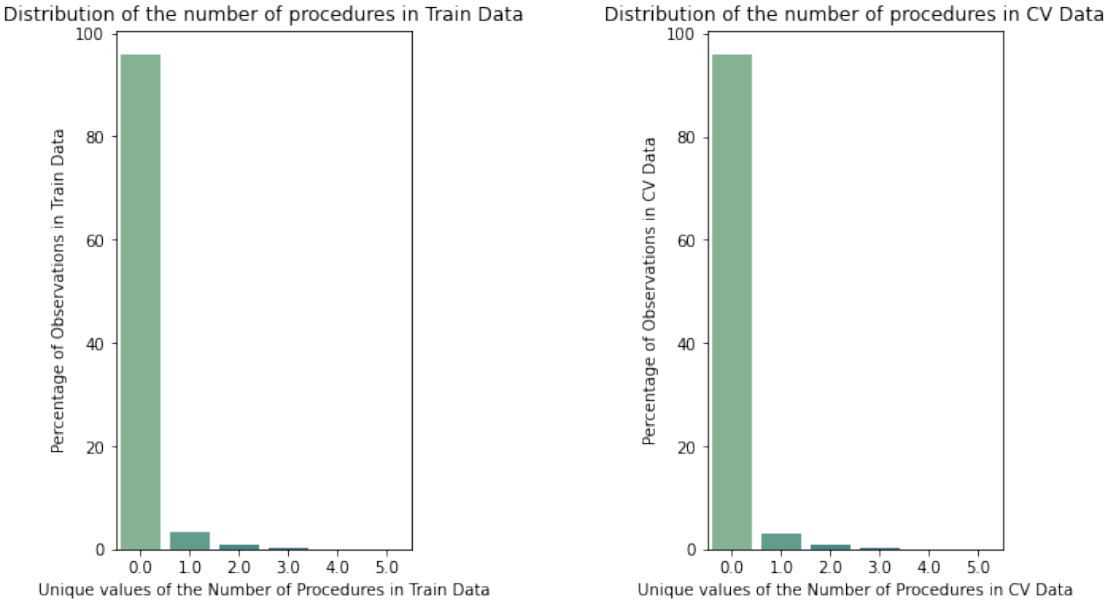
ax2.set_title("Distribution of the number of procedures in CV Data")
plt.subplots_adjust(wspace=1)
plt.show()
```



4.13 Observations

1. As can be seen from the above plot that more than 95% of the precedures have '0' procedures, followed by 1 procedure and so on.
2. This drastic skewnwess in the data could be due to the fact that the Outpatient dataset is dominant in the overall merged dataset and in majority of the Outpatient cases, the patients do not go through any prcedures.
3. In addition to point 2, as most procedures require prepping the patient or stabilizing the patient before the procedure could take 1-2 days hence the patient is most likely to be admitted and treated as an inpatient before carrying out a procedure barring from a very few procedures

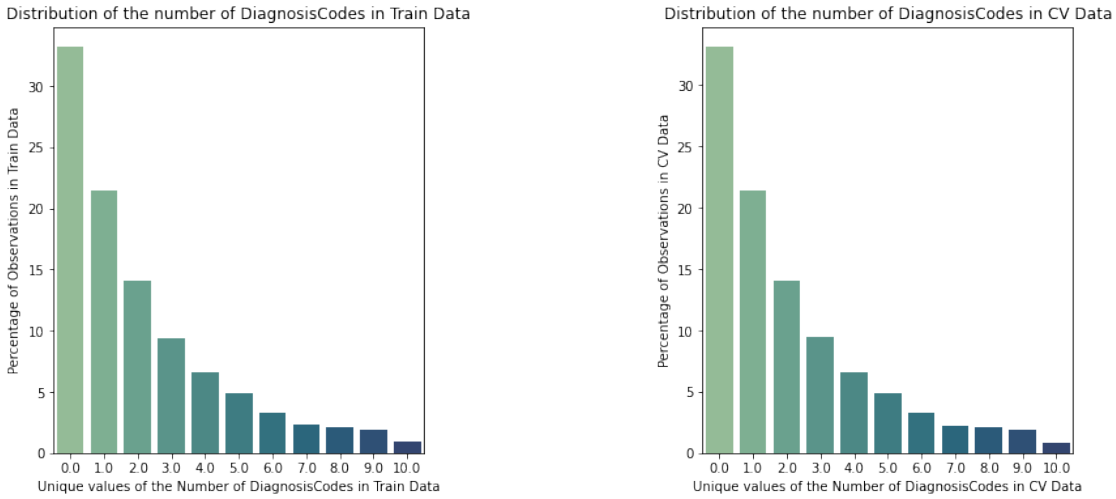
ax1.set_title("Distribution of the number of DiagnosisCodes in Train Data")
ax2.set_title("Distribution of the number of DiagnosisCodes in CV Data")
plt.subplots_adjust(wspace=0.75)
plt.show()
```



4.15 Observations

1. We see that percentage of the observations belonging to the number of the diagnosis codes keeps reducing.
2. This is in agreement with the general phenomenon that more the number of diagnosis codes more complex the ailment of the patient.
3. Patients with severe ailments are usually inpatients and the number of cases in which the ailment is severe is also low.

4.15.1 Dropping the 10 Claim Diagnosis codes variables

[ ]:
```
train_fin.drop(clm_diag,axis=1,inplace= True)
cv_fin.drop(clm_diag,axis=1,inplace= True)
```

4.15.2 Checking the number of NA values in the Outpatient Dataset just to validate our obsevrations and the feature engineering approach

[ ]:
```
print("The NA percentage in the Admission Date variable in Inpatient␣
 ↪Data",(train_inpat['AdmissionDt'].isna().sum()/
 ↪len(train_inpat['AdmissionDt']))*100)
print("The NA percentage in the Discharge Date variable in Inpatient␣
 ↪Data",(train_inpat['DischargeDt'].isna().sum()/
 ↪len(train_inpat['DischargeDt']))*100)
```

```
The NA percentage in the Admission Date variable in Inpatient Data 0.0
The NA percentage in the Discharge Date variable in Inpatient Data 0.0
```

4.16 Observations

Although we see that Admission Date and the Discharge Date have an NA percentage of 92.5, from the above we see that all the NA values have been added by Outpatient and Beneficary datasets.

It needs to be noted that AdmissionDate and DischargeDate columns are bound to be missing in the Inpatient Datasets and the Beneficary Datasets.

4.17 Feature Engineering

I have created a new feature titled "hospital_days" which is taken as a difference between the Discharge Date and the Admission Date features.

I have imputed all the missing values in this feature with Zeros.

I have categorized the "HospitalDays" feature as keeping it a floating point value will introduce too many features and affect the overall distribution of the variable

[ ]:
```
train_fin["HospitalDays"]= pd.to_datetime(train_fin['DischargeDt']) - pd.
 ↪to_datetime(train_fin['AdmissionDt'])
train_fin["HospitalDays"]= train_fin["HospitalDays"].dt.days
```

[ ]:
```
cv_fin["HospitalDays"]= pd.to_datetime(cv_fin['DischargeDt']) - pd.
 ↪to_datetime(cv_fin['AdmissionDt'])
cv_fin["HospitalDays"]= cv_fin["HospitalDays"].dt.days
```

4.17.1 Looking at the distribution of the HospitalDays variable prior to the imputation of the NA values with 0

[ ]:
```
train_fin["HospitalDays"].describe()
```

[ ]:
```
count    32529.00000
mean         5.67303
std          5.65132
```

```
min          0.00000
25%          2.00000
50%          4.00000
75%          7.00000
max         35.00000
Name: HospitalDays, dtype: float64
```

[ ]:
```
fig= plt.figure(figsize=(12,6))
gs= GridSpec(1,2,figure=fig)

ax1= fig.add_subplot(gs[0,0])
ax2= fig.add_subplot(gs[0,1])

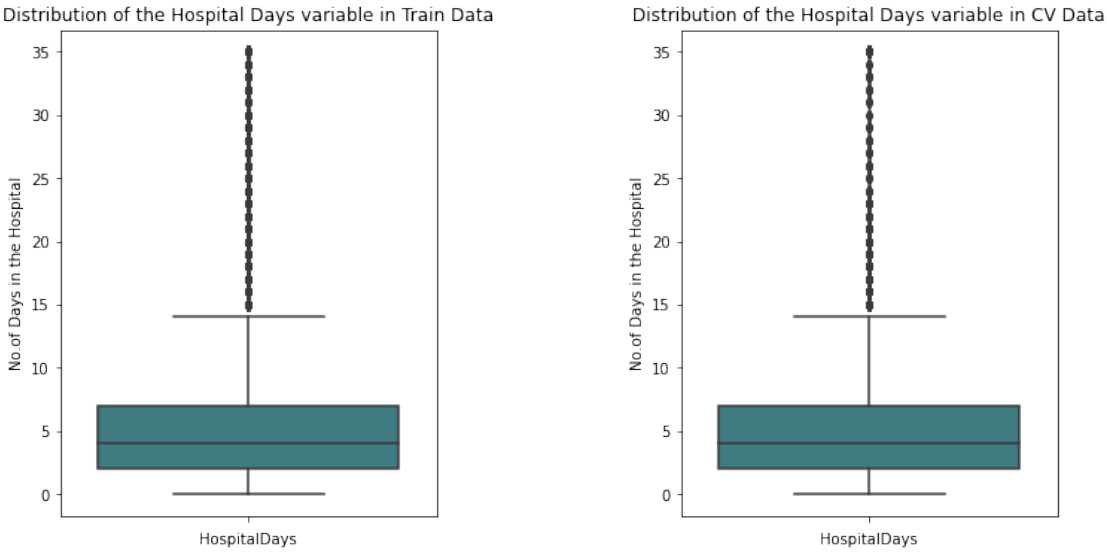
sns.boxplot(ax= ax1,y=train_fin['HospitalDays'],palette='crest')
sns.boxplot(ax= ax2,y=cv_fin['HospitalDays'],palette='crest')

ax1.set_xlabel("HospitalDays")
ax2.set_xlabel("HospitalDays")

ax1.set_ylabel("No.of Days in the Hospital")
ax2.set_ylabel("No.of Days in the Hospital")

ax1.set_title("Distribution of the Hospital Days variable in Train Data")
ax2.set_title("Distribution of the Hospital Days variable in CV Data")
plt.subplots_adjust(wspace=0.65)

plt.show()
```



4.18 Observations

1. We see that in both the train and the cv datasets the median or the 50th percentile value is close to 5 while the 25th and the 75th percentile values are close to 3 and 7 respectively

[ ]:
```
with open('/content/drive/MyDrive/Colab Notebooks/train_fin_n1.pkl','wb') as␣
 ↪tr_df:
    pickle.dump(train_fin,tr_df)
with open('/content/drive/MyDrive/Colab Notebooks/cv_fin_n1.pkl','wb') as cv_df:
    pickle.dump(cv_fin,cv_df)
```

[ ]:
```
with open('/content/drive/MyDrive/Colab Notebooks/train_fin_n1.pkl','rb') as␣
 ↪tr_df:
    train_fin1= pickle.load(tr_df)
with open('/content/drive/MyDrive/Colab Notebooks/cv_fin_n1.pkl','rb') as cv_df:
    cv_fin1= pickle.load(cv_df)
```

[ ]:
```
print(train_fin1['HospitalDays'].isna().sum())
print(cv_fin1['HospitalDays'].isna().sum())
```

```
414039
103698
```

4.19 Imputing the NA values in the HospitalDates variable with 0 values

[ ]:
```
train_fin1["HospitalDays"]=train_fin1["HospitalDays"].fillna(0)
cv_fin1["HospitalDays"]=cv_fin1["HospitalDays"].fillna(0)
```

[ ]:
```
fig= plt.figure(figsize=(12,6))
gs= GridSpec(1,2,figure=fig)

ax1= fig.add_subplot(gs[0,0])
ax2= fig.add_subplot(gs[0,1])

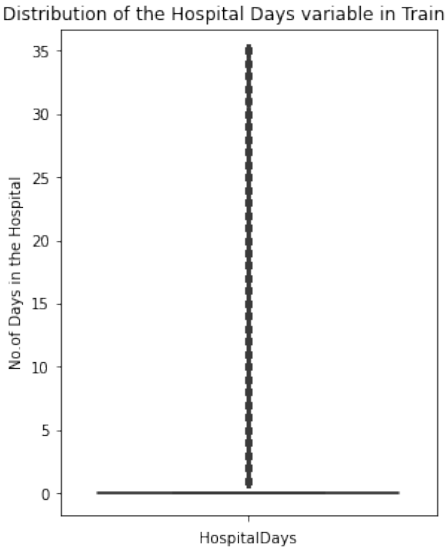
sns.boxplot(ax= ax1,y=train_fin1['HospitalDays'],palette='crest')
sns.boxplot(ax= ax2,y=cv_fin1['HospitalDays'],palette='crest')

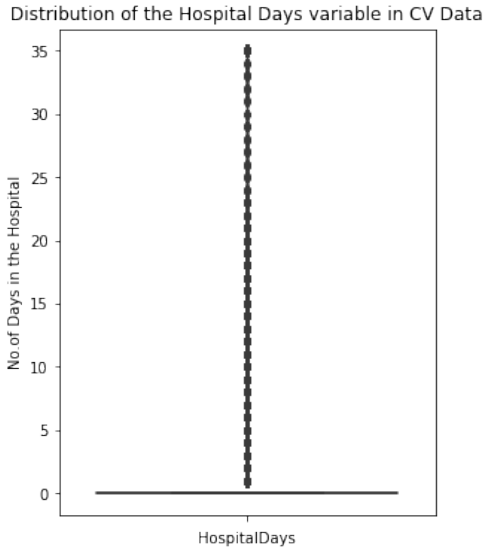
ax1.set_xlabel("HospitalDays")
ax2.set_xlabel("HospitalDays")

ax1.set_ylabel("No.of Days in the Hospital")
ax2.set_ylabel("No.of Days in the Hospital")

ax1.set_title("Distribution of the Hospital Days variable in Train Data")
ax2.set_title("Distribution of the Hospital Days variable in CV Data")
plt.subplots_adjust(wspace=0.65)

plt.show()
```





4.20 Observations

From the above two Box plots it is quite evident that the imputation of the NA values wiht 0 has drastically impacted the overall distribution of the variable in both the Train and CV datasets

4.20.1 Hence Categorizing the variable as per weeks as it introduces ordinality in the feature as well as seperates out the inpatient and the outpatient data

[ ]:
```
for i in tqdm(range(len(train_fin1['HospitalDays']))):
    if train_fin1['HospitalDays'][i]==0.0:
        train_fin1["HospitalDays"][i]= 0
    if train_fin1["HospitalDays"][i]>0 and train_fin1["HospitalDays"][i]<=7:
        train_fin1["HospitalDays"][i]= 1
    elif train_fin1["HospitalDays"][i]>7 and train_fin1["HospitalDays"][i]<=14:
        train_fin1["HospitalDays"][i]= 2
    elif train_fin1["HospitalDays"][i]>14 and train_fin1["HospitalDays"][i]<=21:
        train_fin1["HospitalDays"][i]= 3

```

4.21 Observations

1. As mentioned above 0 would be the highest as they are the imputed observations from the Inpatient and the Outpatient Datasests

2. Other than 0, we see that the maximum days spent in the hospital is less than or equal to 1 week and the number of observations keep decreasing with more weeks

3. This seems to be the general trend as there are fewer chronic illness cases in a hospital and most of the Inpatients are predominantly admitted for shoter duration of time

```

4.24 Observations:

1. The above graphs are inline with the reality or practical situtation. NA values in Operating Physician and Other Physician datasets doesnt mean that the data is missing.

2. As per my secondary research, Operating Physicians are involved in cases where a surgery or other complications are involved

3. OtherPhysicians are involved in cases where the patient has co-morbidities

4.25 Observations on Inpatient Dataset:

1. We have 41% NA values in Operating Physicians column. This means the 59% (100%-41%) of the Inpatients likely needed a surgery or had other complication where as 41% didnt have any complications or didnt need surgery

2. We have 88% NA values in Other Physicians column. This means the 12% (100%-88%) of the Inpatients had co-morbidities where as 12% didnt have co-morbidities

4.26 Observations on Outpatient Dataset:

1. We have 82% NA values in Operating Physicians column. Outpatients do not usually go through surgeries or other complicated procedures in a day

2. We have 62% NA values in Other Physicians column.Outpatients do not usually consult other physicians very often.

4.27 Imputing the Attending Physician with Mode or MostFrequent strategy using SimpleImpute

[ ]:
```
cat_imp= SimpleImputer(missing_values= np.nan, strategy= 'most_frequent')
train_fin1["AttendingPhysician"]= cat_imp.

4.32.1 Looking at the NA value distribtution of the DiagnosisGroupCode variable

[ ]:
```
print("Percentage of NA values in Inpateint Data:␣
↪",(train_inpat['DiagnosisGroupCode'].isna().sum()/
↪len(train_inpat['DiagnosisGroupCode']))*100)
```

```
print("Percentage of NA values in Merged Data: ",np.
 ↪round((train_fin2['DiagnosisGroupCode'].isna().sum()/
 ↪len(train_fin2['DiagnosisGroupCode']))*100))
print("Ratio of Outpatient data to Merged Dataset",np.round((train_outpat.
 ↪shape[0]/(train_fin2.shape[0]+cv_fin2.shape[0]))*100))
```

```
Percentage of NA values in Inpateint Data:  0.0
Percentage of NA values in Merged Data:  93.0
Ratio of Outpatient data to Merged Dataset 93.0
```

4.33 Observations,

1. From the above we see that there are no NA values in the Inpatient data and the variable "DiagnosisGroupCode" is missing in the Outpatient Dataset.

2. https://hmsa.com/portal/provider/zav_pel.fh.DIA.650.htm: clearly states that a Diagnosis-GroupCode is just for the Inpatient Data and not for the outpatient data. Hence NA were introduced during the merger of the Dataset

3 Hence filling the NA as new category with a value of 0

[ ]:
```
train_fin2['DiagnosisGroupCode']= train_fin2['DiagnosisGroupCode'].fillna(0)
cv_fin2['DiagnosisGroupCode']= cv_fin2['DiagnosisGroupCode'].fillna(0)
```

```

```
Percentage of NA values in Inpateint Data:  0.0
Percentage of NA values in Outpateint Data:  80.0
```

4.34 Observations

1. Majority of the categorical columns have a more than 50-100 categories in each of the columns

2. Adopting a one-hot encoding to convert the categorical columns into numerical columns could lead to creation of a lot of columns leading to Curse of Dimensionality

3. Using response coding in order to convert categorical columns to numerical ones.

Response Coding: Calculating the proabilities of each of the categories in a column. Probability is calculated as follows

P(x=c1/y='yes') which is Probability of category in column X, given the Y varibale belongs to class 'Yes' and class 'No'

P(x=c1/y='yes')= (Number of Occurences of C1 where Y belongs to 'yes' class) divided by (Number of Occurences of where Y='yes' + Number of Occurences of where Y='No')

4.35 Feature Engineering

Response Coding of the DiagnosisGroupCode, State,County, BeneID,ClaimID,Provider,AttendingPhysician

```

4.36 Observations

1. From the above graphs we see that close to 99% of the observations have 0 months in both PartACoverage and PartBCoverage in both the train and cv datasets
2. Since most of the column belongs to same category or has a value of 1 month, the variance in the column is close to 0.

3. Due to 0 varinace the contribution of the PartACoverage and PartBCoverage variables to the overall classification of the obsevrations in the PotentialFraud column

Dropping the NoOfMonths PartACov and the NoofMonths PartBCov variables as they are contributing to the classification task.

[ ]:
```
train_fin2.drop(['NoOfMonths_PartACov','NoOfMonths_PartBCov'],axis=1, inplace=␣

ax2.set_title('Distribution of the age variable in CV Data')

plt.subplots_adjust(wspace=0.45)
plt.show()
```

4.38 Observations

1. From the above graphs we see that a vast majority of the patients in the dataset has a age between 65 and 90.
2. The 50th percentile of the age variable in the train and c datasets seems to be close to 75 years and the 25th and the 75th percentile are at 67 and 82 years resepctively confirming point 1
3. The left/bottom tail of the distribution seems to skewed towards more younger ages raning between early 20s to early 60s with the distrbution broadening up with increase in age
4. This is in agreement with the general trend as younger ppl tend to visit the hospital fewer number times than the older population
5. The increase in density could also be due to the fact that older population wiht age between 60 and 80 tend to visit the hospital as a outpatient for their regular check ups or regular visits to theri doctors

Dropping the DOB and DOD columns from the dataset as the information from both the variables has been cpatured in the Age variable

```

5 Multivariate Analysis

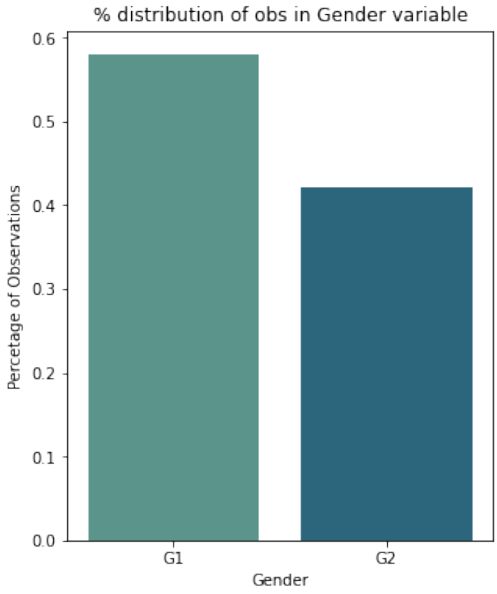
[ ]:
```
fig=plt.figure(figsize=(12,6))
gs= GridSpec(1,2,figure= fig)
ax1= fig.add_subplot(gs[0,0])
ax2= fig.add_subplot(gs[0,1])

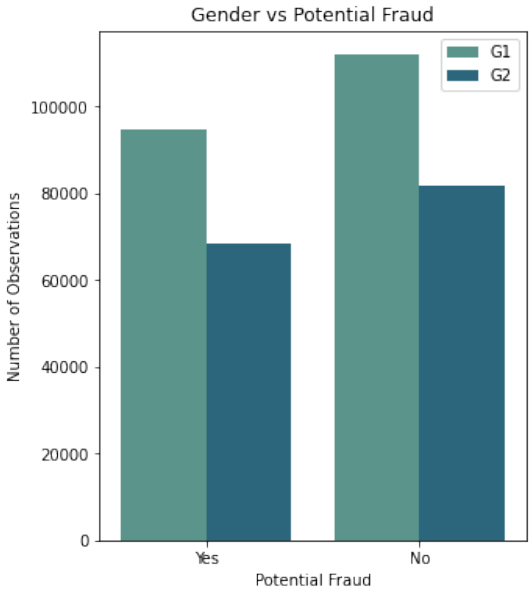
sns.barplot(ax=ax1,x=np.unique(train_fin3['Gender']),y=train_fin3['Gender'].
 ↪value_counts()/len(train_fin3['Gender']),palette='crest')
sns.countplot(x='PotentialFraud',hue='Gender',data=train_fin3, palette='crest',␣
 ↪ax=ax2)

ax1.set_xlabel('Gender')
ax1.set_ylabel('Percetage of Observations')
ax1.set_title('% distribution of obs in Gender variable')

ax2.set_xlabel('Potential Fraud')
ax2.set_ylabel('Number of Observations')
ax2.set_title('Gender vs Potential Fraud')

plt.subplots_adjust(wspace=0.45)
plt.legend(labels= np.unique(train_fin3['Gender']))
plt.show()
```





5.1 Observations

1. Gender 1 is dominant in the overall Gender variable
2. Gender 1 is the dominant of both the genders as majority of observations in both Fraud and Non-Fraud cases belong to Gender 1 confirming wiht point 1

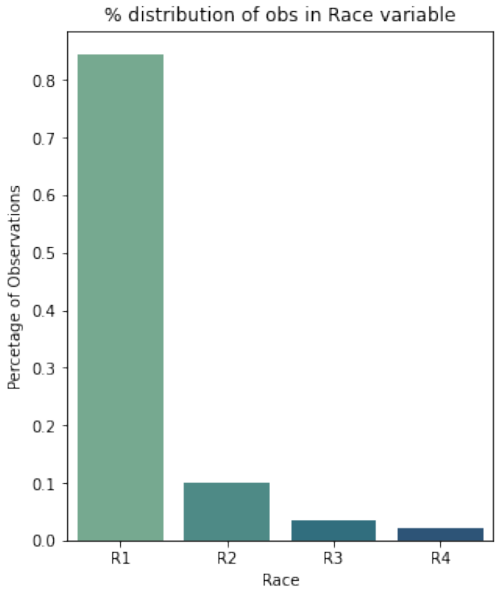
[ ]:
```
fig=plt.figure(figsize=(12,6))
gs= GridSpec(1,2,figure= fig)
ax1= fig.add_subplot(gs[0,0])
ax2= fig.add_subplot(gs[0,1])

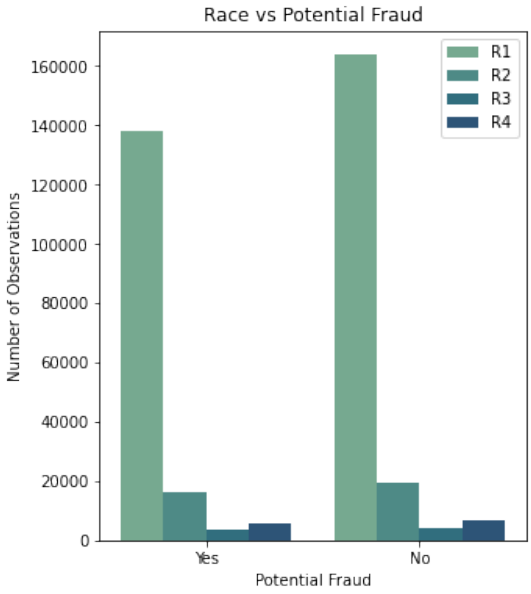
sns.barplot(ax=ax1,x=np.unique(train_fin3['Race']),y=train_fin3['Race'].
 ↪value_counts()/len(train_fin3['Race']),palette='crest')
sns.countplot(x='PotentialFraud',hue='Race',data=train_fin3, palette='crest',␣
 ↪ax=ax2)

ax1.set_xlabel('Race')
ax1.set_ylabel('Percetage of Observations')
ax1.set_title('% distribution of obs in Race variable')

ax2.set_xlabel('Potential Fraud')
ax2.set_ylabel('Number of Observations')
ax2.set_title('Race vs Potential Fraud')

plt.subplots_adjust(wspace=0.45)
plt.legend(labels= np.unique(train_fin3['Race']))
plt.show()
```





5.2 Observations

1.More than 80% of the observations belong to Race 1 as shown in fig.1

2.The distrbution of the observations across races in each of the PotentialFraud cases mirror the overall distribution of the Race variable

[ ]:
```
num_cols=['InscClaimAmtReimbursed','DeductibleAmtPaid','IPAnnualReimbursementAmt','IPAnnualDed

ax=[]

fig= plt.figure(figsize=(20,20))
gs= GridSpec(3,3,figure= fig)
fig.suptitle('Numerical vs PotentialFraud Variables')

for i in range(3):
    for j in range(3):
        ax.append(fig.add_subplot(gs[i,j]))

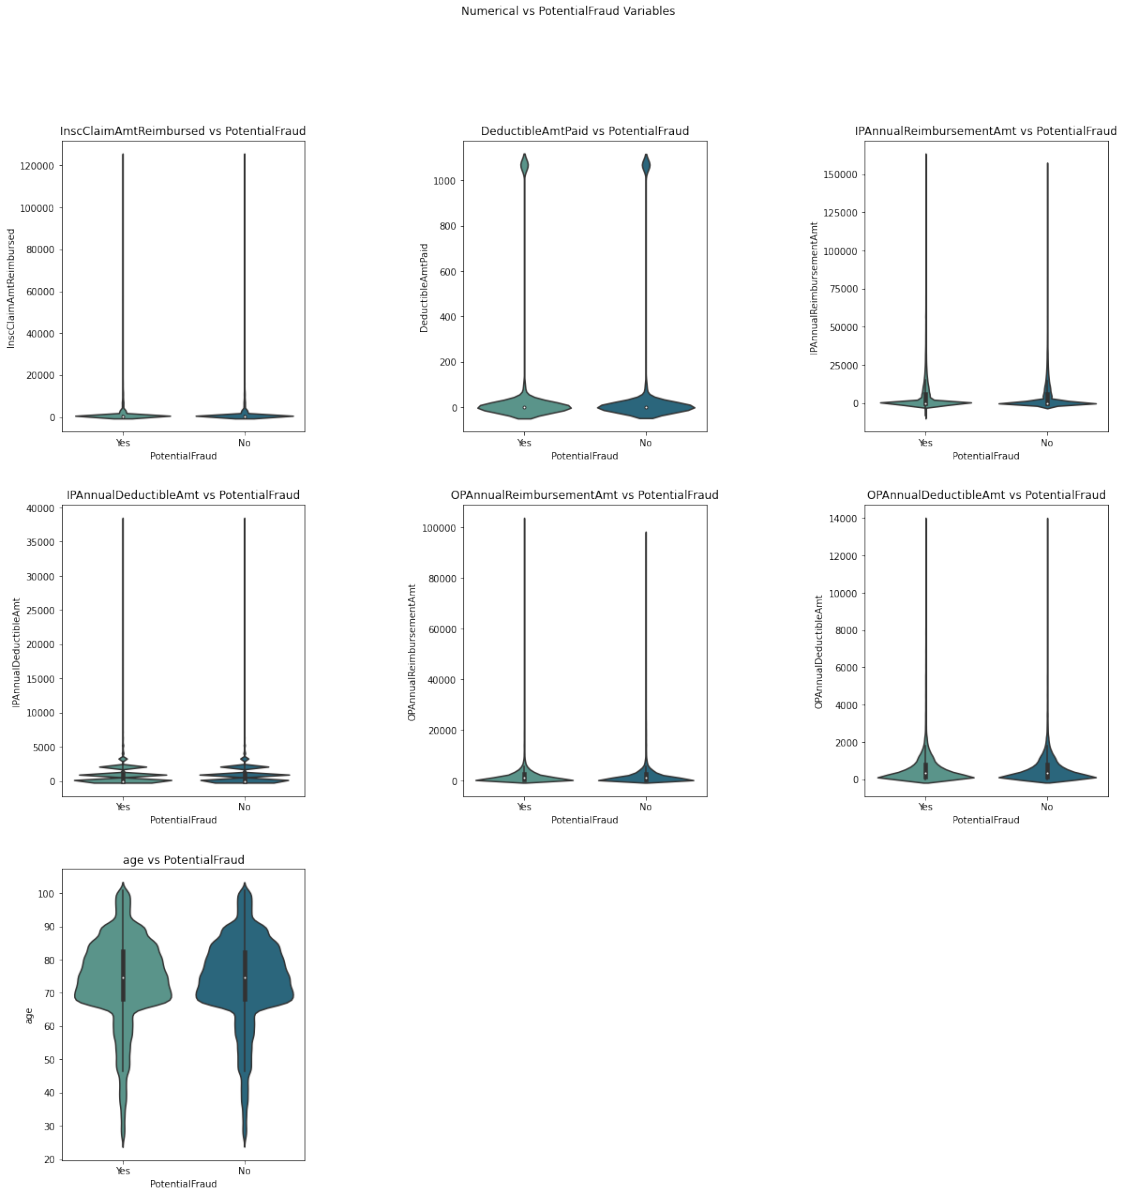
for k in range(7):
    sns.violinplot(ax= ax[k],x='PotentialFraud',y=num_cols[k], data=␣
 ↪train_fin3,palette='crest')
    ax[k].set_title('{} vs PotentialFraud'.format(num_cols[k]))

plt.subplots_adjust(wspace=0.65)
plt.subplots_adjust(hspace=0.25)
#plt.xlabel("NA Percentage in each of the Datasets")

ax[7].remove()
```

```
ax[8].remove()

plt.show()
```



5.3 Observations

1. The above graphs compare the distribution of all the numerical variables aginst the number of classes in the Potential Fraud variable

2. The objective of the above graphs is to see if we could use the box plots to segment the observations within one of the classes of the PotentialFraud variable

3. None of the varibales in the above figures is creating a barrier or a level the effectively seperates out the 'Yes' and 'No' classes of the PotentialFraud variable

4. It is evident that none of the numerical variables are following a perfect normal distribution and are skewed with longer tails

5. The variables 'InscClaimAmtReimbursed', 'IPAnnualReimbursementAmt','OPAnnualReimbursementAmt' are very dense around 0 and tapers off towards the tails which means that there fewer observations with increasing values of the variables

6. IPAnnualDeductibleAmt variable goes through various densisties with increasing value of the amount, this could be because the deductible amount is fixed and subscribed by the customer hence the grouping is happening at different levels of values of the Deductible Amount variable.

7. No inference can be drawn in terms of tagging an observation as Fraud and Non-Fraud just by looking at the distribution of the Age varible as the distribution of the Age variable is identical for both the classes of PotentialFraud

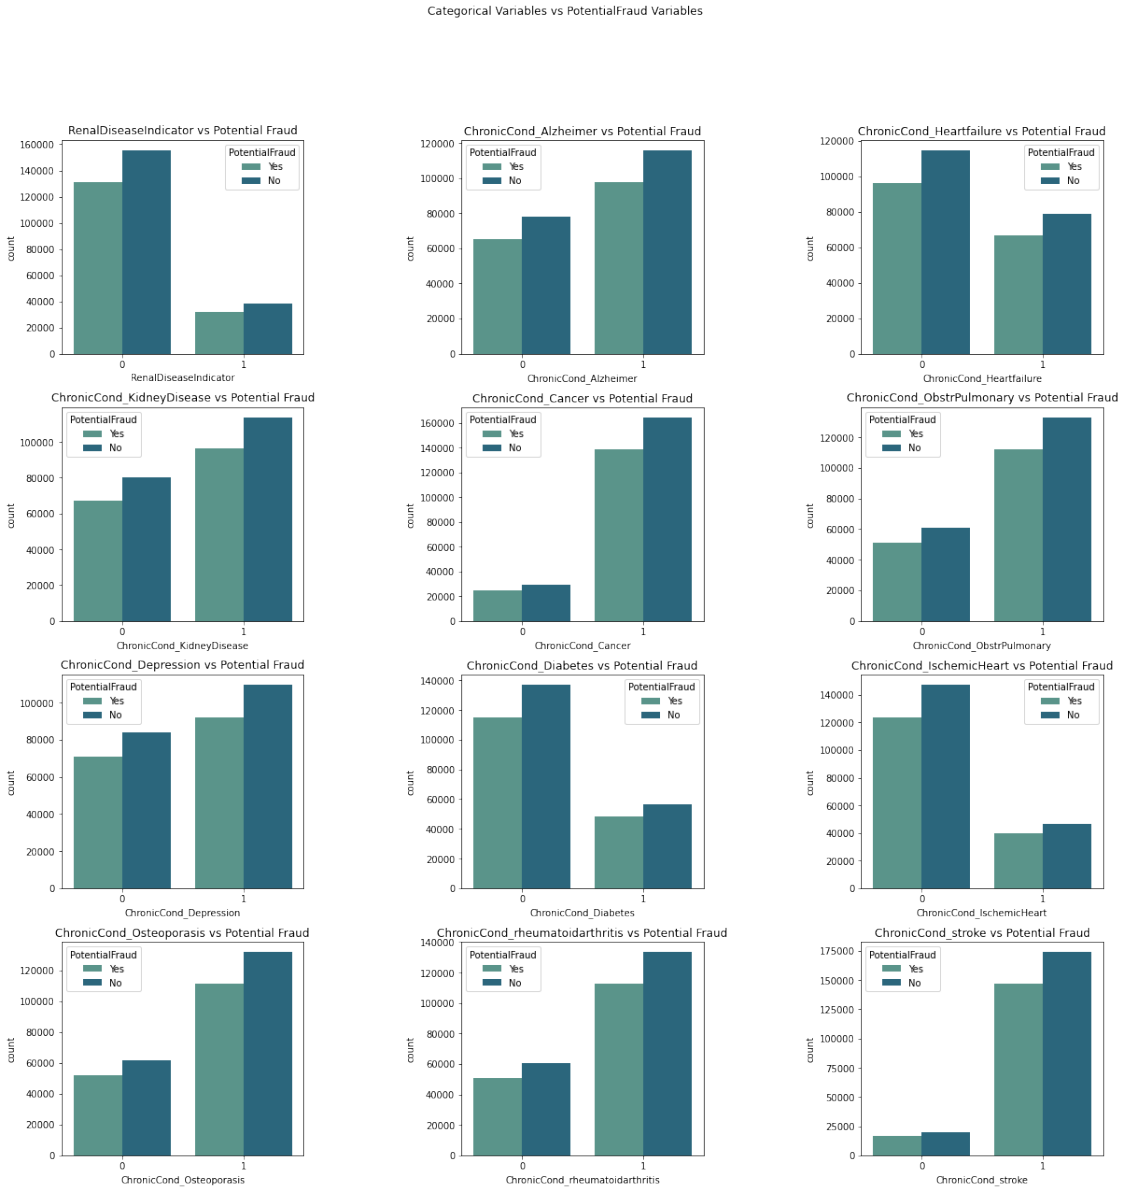
[ ]:
```
cat_cols=␣
 ↪['RenalDiseaseIndicator','ChronicCond_Alzheimer','ChronicCond_Heartfailure','ChronicCond_Ki
ax=[]

fig= plt.figure(figsize=(20,20))
gs= GridSpec(4,3,figure= fig)
fig.suptitle('Categorical Variables vs PotentialFraud Variables')

for i in range(4):
    for j in range(3):
        ax.append(fig.add_subplot(gs[i,j]))

for k in range(12):
    sns.countplot(x=cat_cols[k],hue='PotentialFraud',data=train_fin3,␣
 ↪palette='crest', ax=ax[k])
    ax[k].set_title('{} vs Potential Fraud'.format(cat_cols[k]))

plt.subplots_adjust(wspace=0.65)
plt.subplots_adjust(hspace=0.25)
#plt.xlabel("NA Percentage in each of the Datasets")
plt.show()
```



5.4 Observations

1. The above figures compare the distribution of the categorical variables against the number of classes in the Potential Fraud variable
2. The figure gives the counts of each of the classes associated to each of the 'Yes' and 'No' classes of the Potential Fruad variable

[ ]:
```
res_cols=['DGC_Yes','DGC_No','State_Yes','State_No','County_Yes','County_No','CID_Yes','CID_No

ax=[]
```

```
fig= plt.figure(figsize=(20,20))
gs= GridSpec(4,4,figure= fig)
fig.suptitle('Response Coded Categorical Variables vs Potential Fraud Variable')

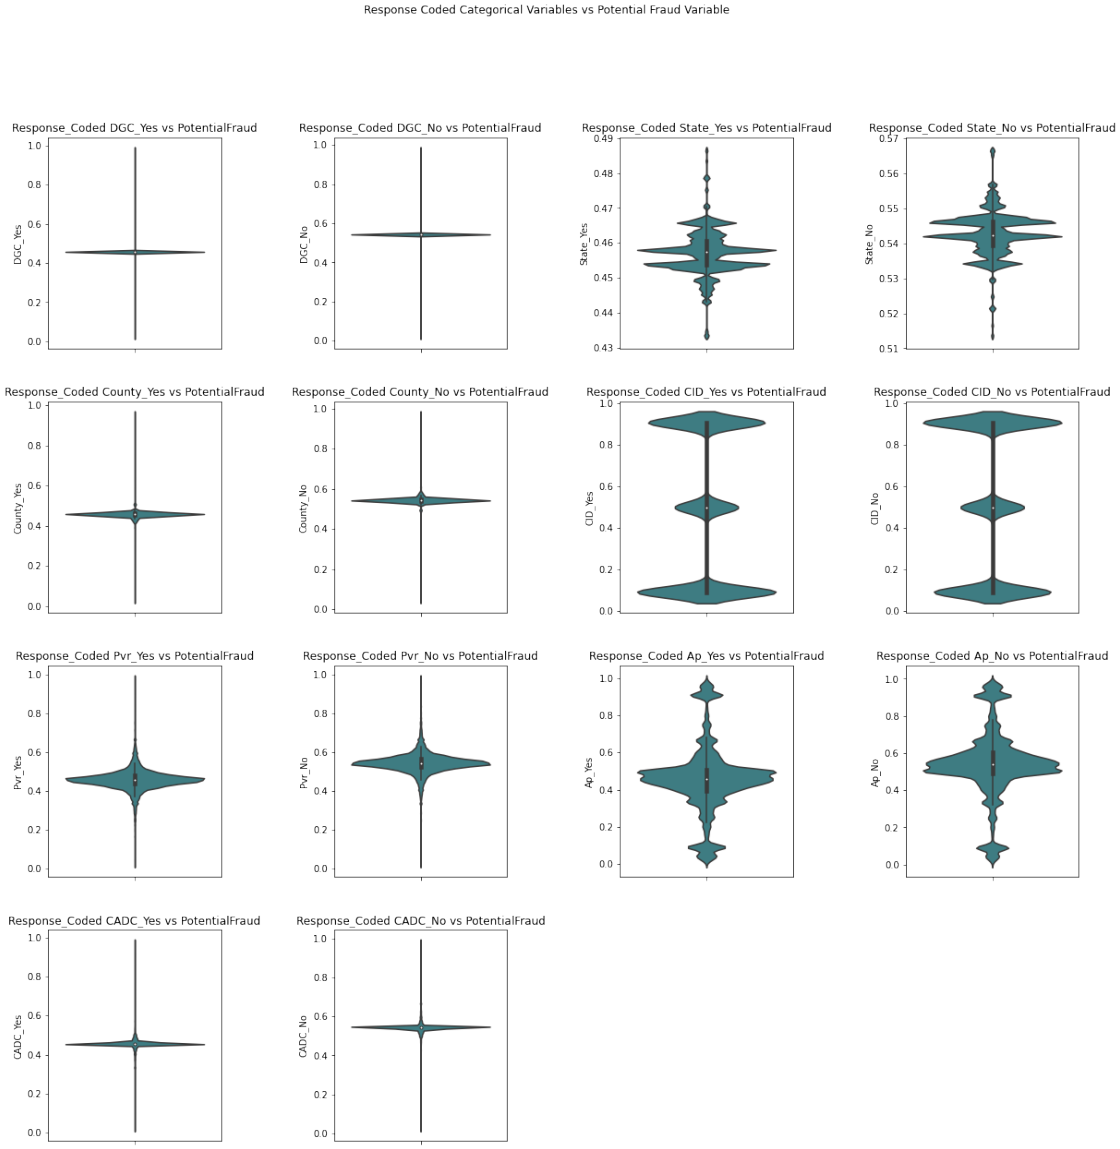
for i in range(4):
    for j in range(4):
        ax.append(fig.add_subplot(gs[i,j]))

for k in range(14):
    sns.violinplot(ax= ax[k],y=res_cols[k], data= train_fin3,palette='crest')
    ax[k].set_title('Response_Coded {} vs PotentialFraud'.format(res_cols[k]))

plt.subplots_adjust(wspace=0.65)
plt.subplots_adjust(hspace=0.25)

ax[14].remove()
ax[15].remove()

plt.show()
```



5.5 Observations

1. The above graphs compare the distribution of all the variables which have gone through Response Coding aginst the number of classes in the Potential Fraud variable

2. The variables DiagnosisGroupCodes(DGC),County,Provider(Pvr) and ClaimAdmitDiagnosisCodes(CADC) are very dense around a small number of values. These values do not effectively segregate the PotentialFraud classes.

3. The variables State, AttendingPhysician and ClaimID are densely distributed around some values. For example, for the state variable there a few states where the number of observations are very high which could be due to the size of the states as some states could have more number of people than the others

4. Similarly, ClaimID variable has higher densities around 3 different groups of claimIDs

[ ]:
```
num_cols=['InscClaimAmtReimbursed','DeductibleAmtPaid','IPAnnualReimbursementAmt','IPAnnualDed
```

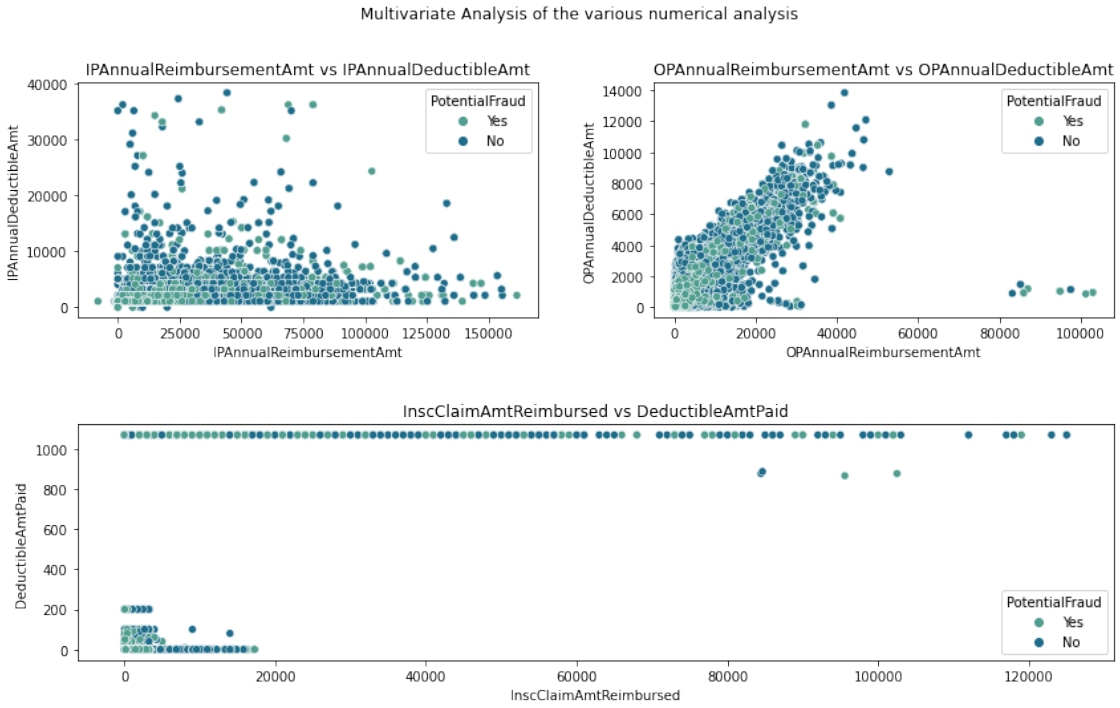
plt.subplots_adjust(wspace=0.25)
plt.subplots_adjust(hspace=0.45)

plt.show()
```



5.6 Definitions

Medical Reimbursement: Healthcare reimbursement describes the payment that your hospital, doctor, diagnostic facility, or other healthcare providers receive for giving a medical service. Often, health insurer or a government payer covers the cost of all or part of the health care.

Deductible: If a health insurance plan has a deductible of 3000 dollars the insured/inidvidual will have to pay all the medical expenses until 3,000 dollars. Anything above $3000,the insurance will start paying for the services.

5.7 Observations

1. **IPAnnualReimbursementAmt vs IPAnnualDeductibleAmt:** From the above definition, we see from a high desnity that the Inpatient deductible amount is fixed in between and 0 and 10000 dollars. Due to the same reason we see a lot of grouping of points at the bottom half of the plot.

2. **OPAnnualReimbursementAmt vs OPAnnualDeductibleAmt:** There is a clear increasing trend and a very disticnt grouping of the observations tagged as Fraud in the bottom part of the plot. **The ranges for most of the Fraud cases are in the region where Deductible amount is between 0 and 3,000 dollars and the Reimbursement amount between 0 and 10,000 dollars.**

3. **InscClaimAmtReimbursed vs DeductibleAmtPaid:** This plot clealy shows the ranges of Deductible amout paid. We see grouping of observations at levels where deductible amount is 0-150 dollars, 200 dollars and greater than 1000 dollars.

[ ]:
```
fig= plt.figure(figsize=(14,8))
gs= GridSpec(2,2,figure=fig)

fig.suptitle('Multivariate Analysis of Age with various Deductible Amount Paid␣
 ↪Variables')

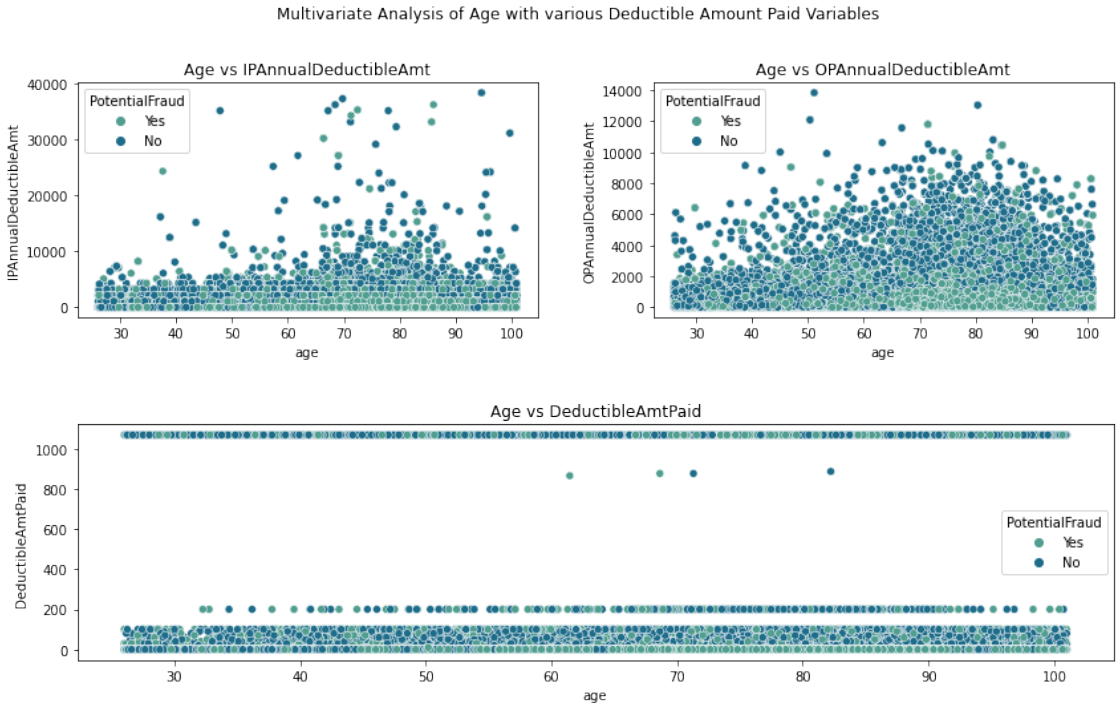
ax1= fig.add_subplot(gs[0,0])
ax2= fig.add_subplot(gs[0,1])
ax3= fig.add_subplot(gs[1,:])

#sns.scatterplot(x='InscClaimAmtReimbursed',y='age',␣
 ↪hue='PotentialFraud',data=train_fin3,ax=ax1,palette='crest')
sns.scatterplot(x='age',y='DeductibleAmtPaid',␣
 ↪hue='PotentialFraud',data=train_fin3,ax=ax3,palette='crest')
sns.scatterplot(x='age',y='IPAnnualDeductibleAmt',␣
 ↪hue='PotentialFraud',data=train_fin3,ax=ax1,palette='crest')
sns.scatterplot(x='age',y='OPAnnualDeductibleAmt',␣
 ↪hue='PotentialFraud',data=train_fin3,ax=ax2,palette='crest')

#ax1.set_title('InscClaimAmtReimbursed vs Age')
ax3.set_title('Age vs DeductibleAmtPaid')
ax1.set_title('Age vs IPAnnualDeductibleAmt')
ax2.set_title('Age vs OPAnnualDeductibleAmt')

plt.subplots_adjust(wspace=0.25)
plt.subplots_adjust(hspace=0.45)

plt.show()
```



5.8 Observations

1. Although smal groups of fraud observations are seen in the age range of 45 to 90 years, fraud observations are spread across all the ranges of age as is quite evident from all the 3 plots above.

2. The distribution of the observations along the Y-axis seems to be in accordance with the levels that exist in the Deductible Amount Paid variable.

8.5 Observations on Experiment 1:

1. From the above we see that the lightGBM model has out performed Random Forests classifier and logistic regression
2. lightGBM outputs on TRAIN DATA- Recall_Score: 0.91079, Precision_Score:0.91058 and a weighted F1 score:0.91065
3. lightGBM outputs on CV DATA- Recall_Score: 0.910, Precision_Score:0.909 and a weighted F1 score:0.909

8.6 Next Steps:

1. Check for multicorrelation amongst the features and see if decreasing the multicorrelation could imporve the performance of the models
2. Use VIF scores to see for multicorrelation and evaluate the features with high VIF scores

8.6.1 Standardizing the below columns using the StandardScaler function

[ ]:
```
cols=['State_Yes', 'State_No', 'County_Yes',
       'County_No', 'DGC_Yes', 'DGC_No', 'BID_Yes', 'BID_No', 'CID_Yes',
       'CID_No', 'Pvr_Yes', 'Pvr_No', 'Ap_Yes', 'Ap_No', 'CADC_Yes',
       'CADC_No', 'comorbid', 'operating', 'operating&comorbid', 'simple',
       'G1', 'G2', 'R1', 'R2', 'R3', 'R4']
```

```
scaler= StandardScaler()

for i in tqdm(cols):
    scaler.fit(train_fin4[i].values.reshape(-1,1))
    train_fin4[i]= scaler.transform(train_fin4[i].values.reshape(-1,1))
    cv_fin4[i]= scaler.transform(cv_fin4[i].values.reshape(-1,1))
```

```
100%|
| 26/26 [00:00<00:00, 126.37it/s]
```

8.6.2 Calculating the VIF of each of the columns to look at the correlation between the variables

[ ]:
```
from statsmodels.stats.outliers_influence import variance_inflation_factor
vif_data= pd.DataFrame()
vif_data['Feature']= train_fin4.columns
vif_data["VIF"] = [variance_inflation_factor(train_fin4.values, i)
                           for i in range(len(train_fin4.columns))]
print(vif_data.shape)
```

```
(49, 2)
```

[ ]:
```
print(vif_data)
```

```
                          Feature           VIF

```

8.7 Dummy Variable Trap

8.7.1 The Very high values of VIF is due to the Dummy Variable Trap hence dropping one of the dummies created by each of the variables

[ ]:
```
no_cols=['State_No','County_No','DGC_No','BID_No','CID_No','Pvr_No','Ap_No','CADC_No','simple'
train_fin4.drop(no_cols,axis=1,inplace=True)
cv_fin4.drop(no_cols,axis=1,inplace=True)
```

8.7.2 Calculating the VIF after dropping the columns with dummy variable trap

[ ]:
```
from statsmodels.stats.outliers_influence import variance_inflation_factor
vif_data= pd.DataFrame()
vif_data['Feature']= train_fin4.columns
vif_data["VIF"] = [variance_inflation_factor(train_fin4.values, i)
                           for i in range(len(train_fin4.columns))]
print(vif_data)
```

```
                          Feature       VIF
```

9.6 Observations on Experiment 2:

1. The performance of all the supervised models in experiment 2 is below par than all the supervised models in Experiment 1.
2. Although the lightGBM out performed Random Forests classifier and logistic regression in experiment 2 there has not been any improvement in the scores compared to experiment 1.

9.7 Next Steps:

1. Correcting for Class Imbalance using SMOTE Oversampling techniques to see if the performance of the models might improve.

10 Expriment 3:

10.1 Using SMOTE Oversampling technique in order to create a dataset corrected for Data imbalance

[ ]:
```
pip install imblearn
```

```

10.6 Observations on Experiment 3:

1. The performance of all the supervised models in experiment 3 has further decreased compared to experiments 1 and 2.
2. lightGBM out performed Random Forests and xgboost in experiment 3 there has not been any improvement in the scores compared to experiments 1 and 2.

11 Expriment 4:

11.1 Using PCA in order to create a dataset of completely Independent Features to chcek for imporvement in Model Performance

[ ]:
```
from sklearn.decomposition import PCA
from sklearn.decomposition import IncrementalPCA

pca= IncrementalPCA(n_components=32,batch_size=50)

train_pca= pca.fit_transform(train_x_smt)
cv_pca= pca.transform(cv_x_smt)
```

[ ]:
```
with open('/home/megha_murthy_n/train_pca.pkl','wb') as tr_pca:
    pickle.dump(train_x_smt,tr_pca)
with open('/home/megha_murthy_n/cv_pca.pkl','wb') as cv_pca:
    pickle.dump(cv_x_smt,cv_pca)
```

[ ]:
```
with open('/home/megha_murthy_n/train_pca.pkl','rb') as tr_pca:
    train_pca= pd.read_pickle(tr_pca)
with open('/home/megha_murthy_n/cv_pca.pkl','rb') as cv_pca:
    cv_pca= pd.read_pickle(cv_pca)
```

11.2 Random Forests post performing PCA

[ ]:
```
from sklearn.ensemble import RandomForestClassifier
rf_best =␣
 ↪RandomForestClassifier(max_depth=35,min_samples_split=100,criterion='gini',n_estimators=150
rf_best.fit(train_pca,train_y_smt)

sig_clf = CalibratedClassifierCV(rf_best, method="sigmoid")
sig_clf.fit(train_pca,train_y_smt)

train_y_pred = sig_clf.predict_proba(train_pca)
train_y_pred = train_y_pred[:,1]
cv_y_pred = sig_clf.predict_proba(cv_pca)
cv_y_pred = cv_y_pred[:,1]
```

11.7 Observations

1. The performance of the models has further deteriorated in experiments 3 and 4.
2. In conclusion we have the best performnace of Recall Score of 0.910 and Precision score of 0.909 and weighted F1 score of 0.910 in the case of Experiment 1 where we ran lightGBM on Datasets with out correcting for Class Imbalance in the Dataset.
